                                                                                                                                                                                                                                                                                                                                                                                   CC typertension. The nucleic acids including the polymorphic sites can be cused as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension, within a gene, they are likely to have a causative role in the polymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes clinsipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC inspiritus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary spherocytosis, von Willebrands disease, colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC forensics to identify individuals

                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic cc regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension, within a gene, they are likely to have a causative role in CC hypertension. This information can be used to find the precise role of a CC polymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes CC insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic cuberous sclerosis, hereditary spherocytosis, von Willebrands disease, familial hypercholesterolemia, familial and

                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides polymorphic fragments of genes associated with the present of the polymorphic sites can be completed as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with disease, they are likely to have a causative role in hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential crops which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tand the polymorphisms in the disease, hemorrhagica telangisctasia, familial theorems of the polymorphisms can be tested for association with other diseases, muscular dystrophy, wiskott-Aldrich cyndrome, Fabrys disease, familial hypercholesterolemia, polycystic chalcular polycystic, hereditary spherocytosis, von Willebrands disease, familial hypercholesterolemia, polycystic contents and polycystic polycystic process of the polymorphisms and polycystic contents and polycystic p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides polymorphic fragments of genes associated with the prevention. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with hypertension, within a gene, they are likely to have a causative role in hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for a sesociation with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-wyhan syndrome, muscular dystrophy, wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocyposis, von Willebrands disease.

This enhancer element is derived from the flanking region of the human epithelial cell cytokeratin-8 gene. (Updated on 25-MAR-2003 to correct Plepithelial cell cytokeratin-8 gene.                                                                          Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of digestive system, particularly cancer and cancer metastases.
                                                                                                                                      WPI;
The present invention provides the protein and coding sequences number of human digestive system antigens. These can be used in

Claim

28

SEQ ID NO 551; 526pp; English.

CC humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A CC pathological condition can be determined by detecting the presence or absence of a mutation in a liver associated polynucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, CC disorders include autoimmune diseases such as rheumatoid arthritis, CC cardiovascular disorders such as cardiac arrest, cerebrovascular CC disorders such as cardiac arrest, cerebrovascular CC disorders such as cerebral ischaemia, nervous system disorders such as CC disorders such as corneal infection, endocrine disorders such as CC coular disorders such as corneal infection, endocrine disorders such as CC cremature labour and infertility, gastrointestinal disorders such as CC crohn's disease, renal disorders such as glomerulonephritis and CC respiratory disorders such as asthma and pleurisy. The polypeptides can CC candination organs before transplantation, to regenerate tissues and in CC chemotaxis. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly Sequences AAS31827-AAS32182 represent genomic DNA molecules, which extends in the liver associated polypeptides of the invention. Liver associated polypeptides and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types of disorders in humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. at ftp.wipo.int/pub/published_pct_sequences in e. ep. A encode

The binding molecule is selected from an antibody free of natural impurities, a monoclonal antibody or a binding fragment of either of these. The method may be used for diagnosing the presence of Alzheimer's disease, neuroectodermal tumours and a malignant astrocytoma in a human. Expression of NTP nucleic acid may be inhibited using antisense oligonucleotides (See AAT27739-44)
                                                          Testing for the presence of polymorphisms bowel disease, using a hybridization assay

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used

The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be CC used as probes or primers for expressing variant proteins. Detection of CC the polymorphisms is useful in designing prophylactic and therapeutic CC regimes customized to underlying abnormalities. The polymorphisms can be CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a CC polymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease, and this can be used to identify potential CC association with other diseases e.g. agammaglobulinemia, diabetes consipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

         The invention provides polymorphic fragments of genes associated with the pretension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension of diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential of drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes can spociation with other diseases e.g. agammaglobulinemia, diabetes considered the process of t

The binding molecule is selected from an antibody free of natural impurities, a monoclonal antibody or a binding fragment of either of these. The method may be used for diagnosing the presence of Alzheimer's disease, neuroectodermal tumours and a malignant astrocytoma in a human. Expression of NTP nucleic acid may be inhibited using antisense oligonucleotides (See ANT27739-44)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This enhancer element is part of a DNA construct used for treating human carcinoma which contains a cancer therapeutic protein under the control of a promoter and 3 enhancer sequences in a specific 5'-3' order. This enhancer element is derived from the flanking region of the human epithelial cell secretory leukoprotease-inhibitor gene. (Updated on 25-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      श्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC base, or the complement of the segment. Also described are: (1) an allele CC -specific oligonucleotide that hybridises to a segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where CC the polymorphic site within the sequence is occupied by a base other than CC the reference base indicated in the specification; and (3) analysing a CC nucleic acid, comprising obtaining a nucleic acid from an individual, and CC determining a base occupying any one of the polymorphic sites of the CC novelty. The nucleic acid segments and method can be used to analyse an CC individuals nucleic acid segments and method can be used to analyse an CC method can also be used to test for a disease phenotype and correlate the presence of the phenotype with a particular polymorphism. The presence of polymorphisms with phenotypic traits and for genetic CC mapping of phenotypic traits. AAA78631 to AAA79262 represent sequence CC tags of human genomic DNA fragments containing polymorphic sites. The Dase occupying the polymorphic site is indicated using IUPAC-IUB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

            The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential
hypertension. This information opolymorphism in the disease, and drugs which combat the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mRNAs, amplifying the released tags, concater form concatenated tags, amplifying and isolat The present sequence is human tandem tag DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present invention discloses a method for generating five prime biased dem tag libraries of cDNAs. The step involves isolating a sample of the amplifying the released tags, concatenating the amplified tags to concatenated tags, amplifying and isolating the concatenated tags.
                                                                                                                                                                                                                                                                                  JB,

The polymorphic forms can also be used in forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAA04065
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Lesch-Nyhan syndrome; muscular dystrophy; Wiskott-Aldrich syndrome; Fabrys disease; familial hypercholesterolemia; hereditary spherocyt polycystic kidney disease; von Willebrands disease; forensic; human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAA04065;
                                                                                      The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-MAY-1998;

The polymorphic forms can also be used in forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             insipidus,
             hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes association with other diseases e.g. agammaglobulinemia, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; hypertension; agammaglobulinemia; diabetes insipidus; Lesch-Nyhan syndrome; muscular dystrophy; Wiskott-Aldrich syndrome; Fabrys disease; familial hypercholesterolemia; hereditary spherocytosis; polycystic kidney disease; yon Willebrands disease; forensic; human; tuberous sclerosis; hereditary hemorrhagica telangiectasia; familial colonic polyposis; osteogenesis imperfecta; porphyria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

The polymorphic forms can also be used forensics to identify individuals
The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other disease. The polymorphisms can be tested for insiphidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fabrys disease; familial hypercholesterolemia; hereditary spherocytosis; polycystic kidney disease; von Willebrands disease; forenaio, humanitation of the control of the c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be CC used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic CC regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension of CC diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a CC hypertension. This information can be used to identify potential CC drugs which combat the disease, and this can be used to identify potential cansociation with other diseases e.g. agammaglobulinemia, diabetes consistent of the propertension with other diseases e.g. agammaglobulinemia, diabetes consistent of the propertension with other diseases. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes consistent of the propertension with other diseases. The polymorphisms can be tested for the propertension with other diseases. The polymorphisms can be tested for the propertension with other diseases. The polymorphisms can be tested for the propertension with other diseases. The polymorphisms can be tested for the polymorphisms can be tested for the propertension. The polymorphisms can be tested for the polymorphisms can be polymorphisms can be provided to the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential curves which combat the disease. The polymorphisms can be tested for association with other disease e.g. agammaglobulinemia, diabetes in syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, familial hypercholesterolemia, familial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tuberous sclerosis, colonic polyposis, acute intermittent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymorphism; hypertension; agammaglobulinemia; diabetes insipidus; lesch Nyhan syndrome; muscular dystrophy; Wiskott-Aldrich syndrome; Fabrys disease; familial hypercholesterolemia; hereditary spherocytosis; polycystic kidney disease; von Willebrands disease; forensic; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 288
                        The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension of diagnostic assays. Where the polymorphisms have strong correlation with hypertension. This information can be used to find the precise role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential crops which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammagiobulinemia, diabetes canspoints, lessch. Whan syndrome, muscular dystrophy, wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, familial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                      SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune disease, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     includes kits for determining the presence or absence of a SNP, using the oligonuclectides of the invention. The PCR primers are used to amplify a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page 59; 83pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Picoult-Newburg L,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO200129262-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

Picoult-Newburg L,

acid New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc sample.

Claim 1; Page 68; 83pp; English

SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscula: dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune afficered. includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide arthritis, muscular γď 엺

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 30
                                                                                                                                                                                                                                                                             Alu 1 and Alu 2 probes were used in hybridisations carried out in an aq. medium comprising a cocktail of: 10% chondroltin sulphate A; 45% medium comprising a cocktail of: 10% chondroltin sulphate A; 45% furnamide;5X saline citrate;25mM phosphate; & 250 micro-g/ml sheared herring sperm DNA. The probes were chemically labelled with 3-4 biotin molecules per probe at the 3'termini. Excellent staining of the DNA of human cell nuclei resulted when either of the Alu 1 or Alu 2 probes were present at 60 ng/ml (or each was present at 30 ng/ml) of the probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US5116727-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAQ25353 standard;

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC indigenucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC identity of a SNP and for genotyping nucleic acid sample by CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Leech-Nyhan syndrome, muscular CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC diseases, including, rheumatoid arthritis, multiple scherosis, cancer, mervous system diseases and infection by pathogenic CC inflammation, cancer, nervous system diseases and infection by pathogenic CC inflammation. The method is also useful in forensic investigations and cCC enteroity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA

                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                              CC The invention relates to detecting integrated retroviruses in a human CC tissue sample comprising amplifying DNA in the sample with polymerase CC chain reaction (PCR) using one primer for an Alu sequence and the other CC primer for a retroviral sequence (e.g. human immunodeficiency virus 1 CC long terminal repeat, LTR), hybridising the PCR-amplified DNA with a CC probe that specifically recognises the amplified retroviral sequence and CC detecting hybridisation of the probe, where the hybridisation indicates CC detecting integrated retroviruses in human tissue sample such as paraffin CC embedded tissue sections or frozen tissue sections of lymphocytes, blood, CC rlymph nodes. The method quantitatively determines the number of cells with integrated HIV in the human tissue sample. The method is useful for CC determining and monitoring latent infection, preferably human CC immunodeficiency virus (HIV) latent infection in patients. The method conly detects integrated retroviruses, and thus allows accurate assessment CC of the frequency of productively and latently infected cells together in CC subjects undergoing anti-retroviruses, and the sample to the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latently infected cells so that they can conitor the presence of latent sequence of latent sequence continued or not. The present conicon the contin

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for cancers, in particular neural cell, lung and prostate tumours. The present sequence is a PCR primer useful for detecting the coding sequences of markers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using array of neoplastic molecular marker specific reagents and analyzing the array of the

The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Testing for the bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      10-DEC-1999; 99US-0170257P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides polymorphic fragments of genes associated with the phypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension with diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, mascular dystrophy, wiskott-Aldrich cyndrome, Fabrys disease, familial hypercholesterolemia, polycystic chalcular disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary spherocytosis, von Willebrands disease, familial colonic polyposis, Bheers-Danlos syndrome, osteogenessis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

0,

Producing sub-population of differences in RNA profiles

labeled between

nucleic acids, useful for analyzing several different physiological

sources, using

set of distinct gene specific primers.

The present sequence is a human gene specific PCR primer used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for producing a sub-population of labeled NAs which is useful for analysing the differences in the RNA profiles between several

The methods can be used to detect the presence of genetic golymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polycystic kidney disease; von Willebrands disease; forensi

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in
                                                                                                                                                                                                                                                                                                                                 07-MAY-1998;

AFFYMETRIX INC. UNIV CASE WESTERN RESERVE.

The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hypertension. This information can be used to find the precise role of polymorphism in the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabbtes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Ehers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals

The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria. The polymorphic forms can also be used in forensics to identify individuals
                     The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-MAY-1998;
